<http://www-bcf.usc.edu/~jbarbic/cs480-s12/>

Outline

- Global and Local Illumination
- Normal Vectors
- Light Sources
- Phong Illumination Model

Global Illumination

- Ray tracing
- Radiosity
- Photon Mapping
- Follow light rays through a scene
- Accurate, but expensive (off-line)

Tobias R. Metoc

Raytracing Example

Martin Moeck,
Siemens Lighting

Radiosity Example

Local Illumination

- Approximate model
- Local interaction between light, surface, viewer
- **Phong model** (this lecture): fast, supported in OpenGL
- GPU shaders
- Pixar Renderman (offline)

Local Illumination

- Approximate model
- Local interaction between light, surface, viewer
- Color determined only based on surface normal, relative camera position and relative light position
- What effects does this ignore?

Outline

- Global and Local Illumination
- **Normal Vectors**
- Light Sources
- Phong Illumination Model

Normal Vectors

- Must calculate and specify the normal vector
 - Even in OpenGL!
- Two examples: plane and sphere

Normals of a Plane, Method I

- Method I: given by $ax + by + cz + d = 0$
- Let p_0 be a known point on the plane
- Let p be an arbitrary point on the plane
- Recall: $u \cdot v = 0$ if and only if u orthogonal to v
- $n \cdot (p - p_0) = n \cdot p - n \cdot p_0 = 0$

- Consequently $n_0 = [a \ b \ c]^T$
- Normalize to $n = n_0/|n_0|$

Normals of a Plane, Method II

- Method II: plane given by p_0, p_1, p_2
- Points must not be collinear
- Recall: $u \times v$ orthogonal to u and v
- $n_0 = (p_1 - p_0) \times (p_2 - p_0)$
- Order of cross product determines orientation
- Normalize to $n = n_0/|n_0|$

Normals of Sphere

- Implicit Equation $f(x, y, z) = x^2 + y^2 + z^2 - 1 = 0$
- Vector form: $f(p) = p \cdot p - 1 = 0$
- Normal given by **gradient vector**

$$n_0 = \begin{bmatrix} \frac{\partial f}{\partial x} \\ \frac{\partial f}{\partial y} \\ \frac{\partial f}{\partial z} \end{bmatrix} = \begin{bmatrix} 2x \\ 2y \\ 2z \end{bmatrix} = 2p$$

- Normalize $n_0/|n_0| = 2p/2 = p$

Reflected Vector

- Perfect reflection: angle of incident equals angle of reflection
- Also: l , n , and r lie in the same plane
- Assume $|l| = |n| = 1$, guarantee $|r| = 1$

$$l \cdot n = \cos(\theta) = n \cdot r$$

$$r = \alpha l + \beta n$$

$$\text{Solution: } \alpha = -1 \text{ and } \beta = 2(l \cdot n)$$

$$r = 2(l \cdot n)n - l$$

Outline

- Global and Local Illumination
- Normal Vectors
- **Light Sources**
- Phong Illumination Model

Light Sources and Material Properties

- Appearance depends on
 - Light sources, their locations and properties
 - Material (surface) properties:

- Viewer position

Types of Light Sources

- **Ambient light:** no identifiable source or direction
- **Point source:** given only by point
- **Distant light:** given only by direction
- **Spotlight:** from source in direction
 - Cut-off angle defines a cone of light
 - Attenuation function (brighter in center)

Point Source

- Given by a point p_0
- Light emitted equally in all directions
- Intensity decreases with square of distance

$$I \propto \frac{1}{|p - p_0|^2}$$

Limitations of Point Sources

- Shading and shadows inaccurate
- Example: penumbra (partial “soft” shadow)
- Similar problems with highlights
- Compensate with attenuation

$$\frac{1}{a + bq + cq^2}$$

$q = \text{distance } |p - p_0|$
 $a, b, c \text{ constants}$

- Softens lighting
- Better with ray tracing
- Better with radiosity

Distant Light Source

- Given by a direction vector
- Simplifies some calculations
- In OpenGL:
 - Point source $[x \ y \ z \ 1]^T$
 - Distant source $[x \ y \ z \ 0]^T$

Spotlight

- Most complex light source in OpenGL
- Light still emanates from point
- Cut-off by cone determined by angle θ

Global Ambient Light

- Independent of light source
- Lights entire scene
- Computationally inexpensive
- Simply add $[G_R \ G_G \ G_B]$ to every pixel on every object
- Not very interesting on its own.
A cheap hack to make the scene brighter.

Outline

- Global and Local Illumination
- Normal Vectors
- Light Sources
- **Phong Illumination Model**

Phong Illumination Model

- Calculate color for arbitrary point on surface
- Compromise between realism and efficiency
- Local computation (no visibility calculations)
- Basic inputs are material properties and \mathbf{l} , \mathbf{n} , \mathbf{v} :

\mathbf{l} = unit vector to light source
 \mathbf{n} = surface normal
 \mathbf{v} = unit vector to viewer
 \mathbf{r} = reflection of \mathbf{l} at \mathbf{p}
(determined by \mathbf{l} and \mathbf{n})

Phong Illumination Overview

1. Start with global ambient light $[G_R \ G_G \ G_B]$
 2. Add contributions from each light source
 3. Clamp the final result to $[0, 1]$
- Calculate each color channel (R,G,B) **separately**
 - Light source contributions decomposed into
 - Ambient reflection
 - Diffuse reflection
 - Specular reflection
 - Based on ambient, diffuse, and specular **lighting and material** properties

Ambient Reflection

$$I_a = k_a L_a$$

- Intensity of ambient light is uniform at every point
- Ambient reflection coefficient k_a , $0 \leq k_a \leq 1$
- May be different for every surface and r,g,b
- Determines reflected fraction of ambient light
- L_a = ambient component of light source
(can be set to different value for each light source)
- Note: L_a is **not** a physically meaningful quantity

Diffuse Reflection

- Diffuse reflector scatters light
- Assume equally all direction
- Called **Lambertian** surface
- Diffuse reflection coefficient k_d , $0 \leq k_d \leq 1$
- Angle of incoming light is important

Lambert's Law

Intensity depends on angle of incoming light.

Diffuse Light Intensity Depends On Angle Of Incoming Light

- Recall

l = unit vector to light

n = unit surface normal

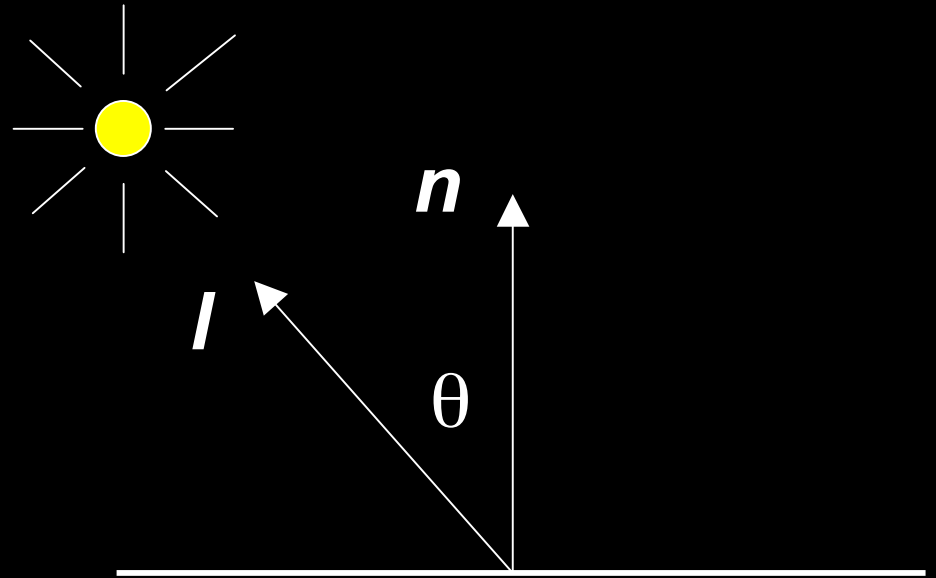

θ = angle to normal

- $\cos \theta = l \cdot n$

- $I_d = k_d L_d (l \cdot n)$

- With attenuation:

$$I_d = \frac{k_d L_d}{a + bq + cq^2} (l \cdot n)$$

q = distance to light source,
 L_d = diffuse component of light

Specular Reflection

- Specular reflection coefficient k_s , $0 \leq k_s \leq 1$
- Shiny surfaces have high specular coefficient
- Used to model specular highlights
- Does **not** give mirror effect (need other techniques)

specular reflection

specular highlights

Specular Reflection

- Recall
 - \mathbf{v} = unit vector to camera
 - \mathbf{r} = unit reflected vector
 - ϕ = angle between \mathbf{v} and \mathbf{r}
- $\cos \phi = \mathbf{v} \cdot \mathbf{r}$

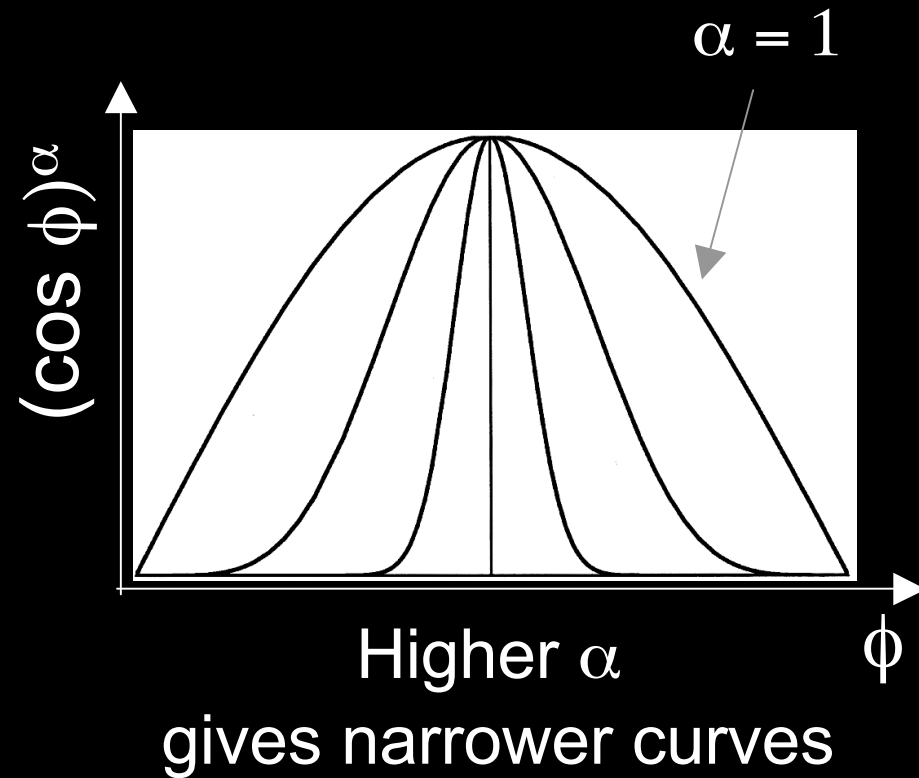

$$I_s = k_s L_s (\cos \phi)^\alpha$$

- L_s is specular component of light
- α is shininess coefficient
- Can add distance term as well

Shininess Coefficient

- $I_s = k_s L_s (\cos \phi)^\alpha$
- α is the shininess coefficient

low α

high α

Univ. of Calgary

Summary of Phong Model

- Light components for each color:
 - Ambient (L_a), diffuse (L_d), specular (L_s)
- Material coefficients for each color:
 - Ambient (k_a), diffuse (k_d), specular (k_s)
- Distance q for surface point from light source

$$I = \frac{1}{a + bq + cq^2} (k_d L_d (l \cdot n) + k_s L_s (r \cdot v)^\alpha) + k_a L_a$$

l = unit vector to light

n = surface normal

r = l reflected about n

v = vector to viewer

BRDF

- Bidirectional Reflection Distribution Function
- Must measure for real materials
- Isotropic vs. anisotropic
- Mathematically complex
- Programmable pixel shading
