Client/Server Model
Callbacks
Double Buffering
Hidden Surface Removal
Simple Transformations
[Angel Ch. 3]

Triangles (Clarification)

- Can be any shape or size
- Well-shaped triangles have advantages for numerical simulation
- Shape quality makes little difference for basic OpenGL rendering

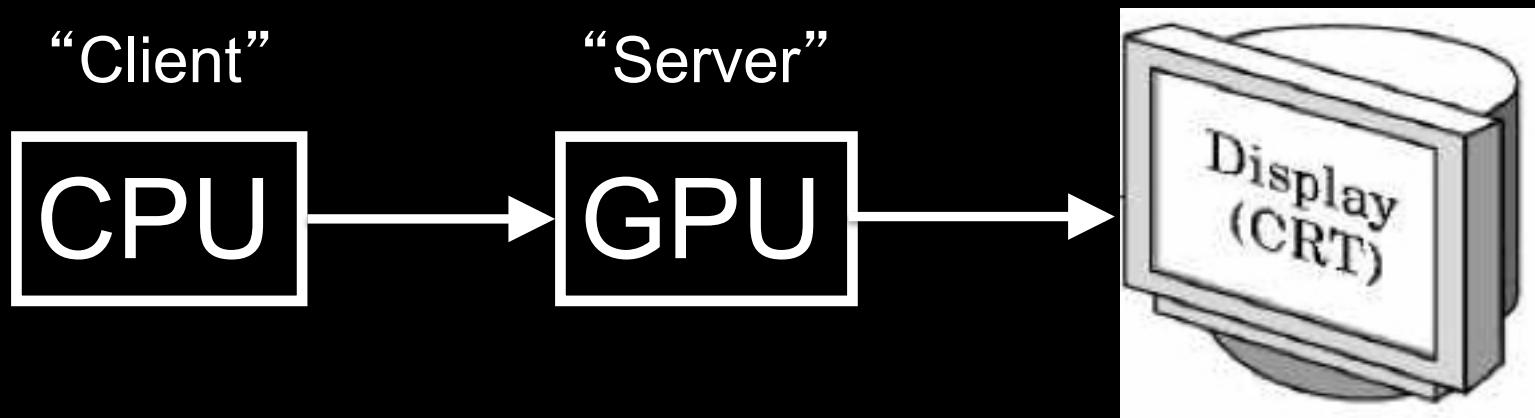

Choice of Programming Language

- OpenGL lives close to the hardware
- OpenGL is not object-oriented
- OpenGL is not a functional language (as in, ML)
- Use C to expose and exploit low-level details
- Use C++, Java, ... for toolkits
- Support for C in assignments

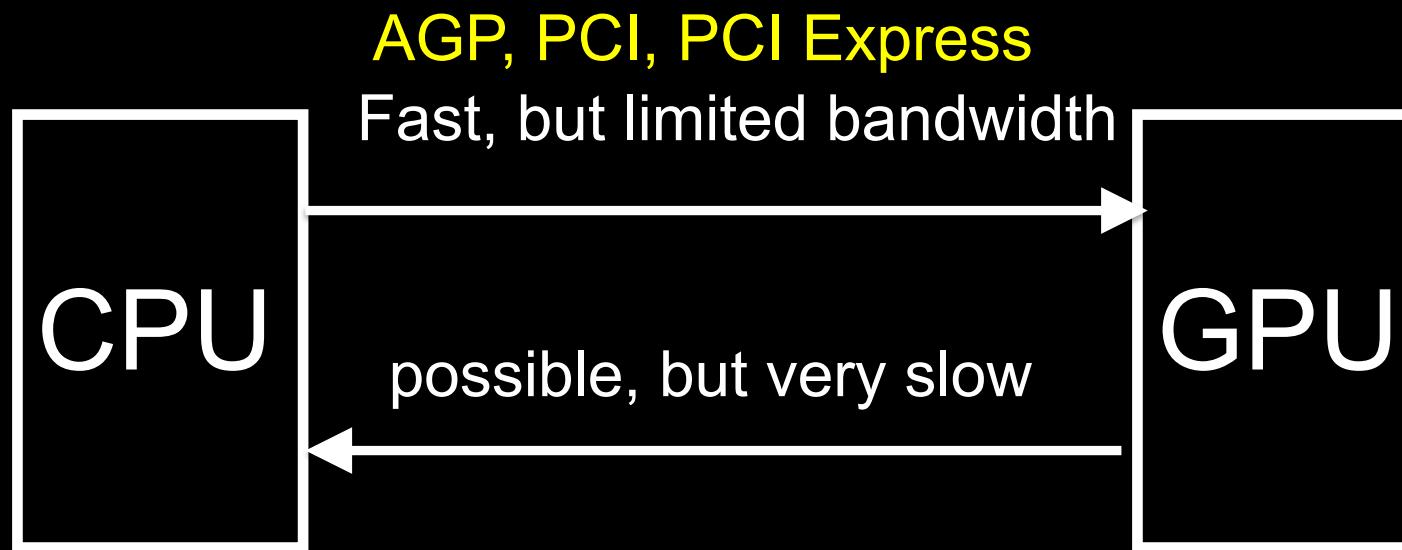

Client/Server Model

- Graphics hardware and caching

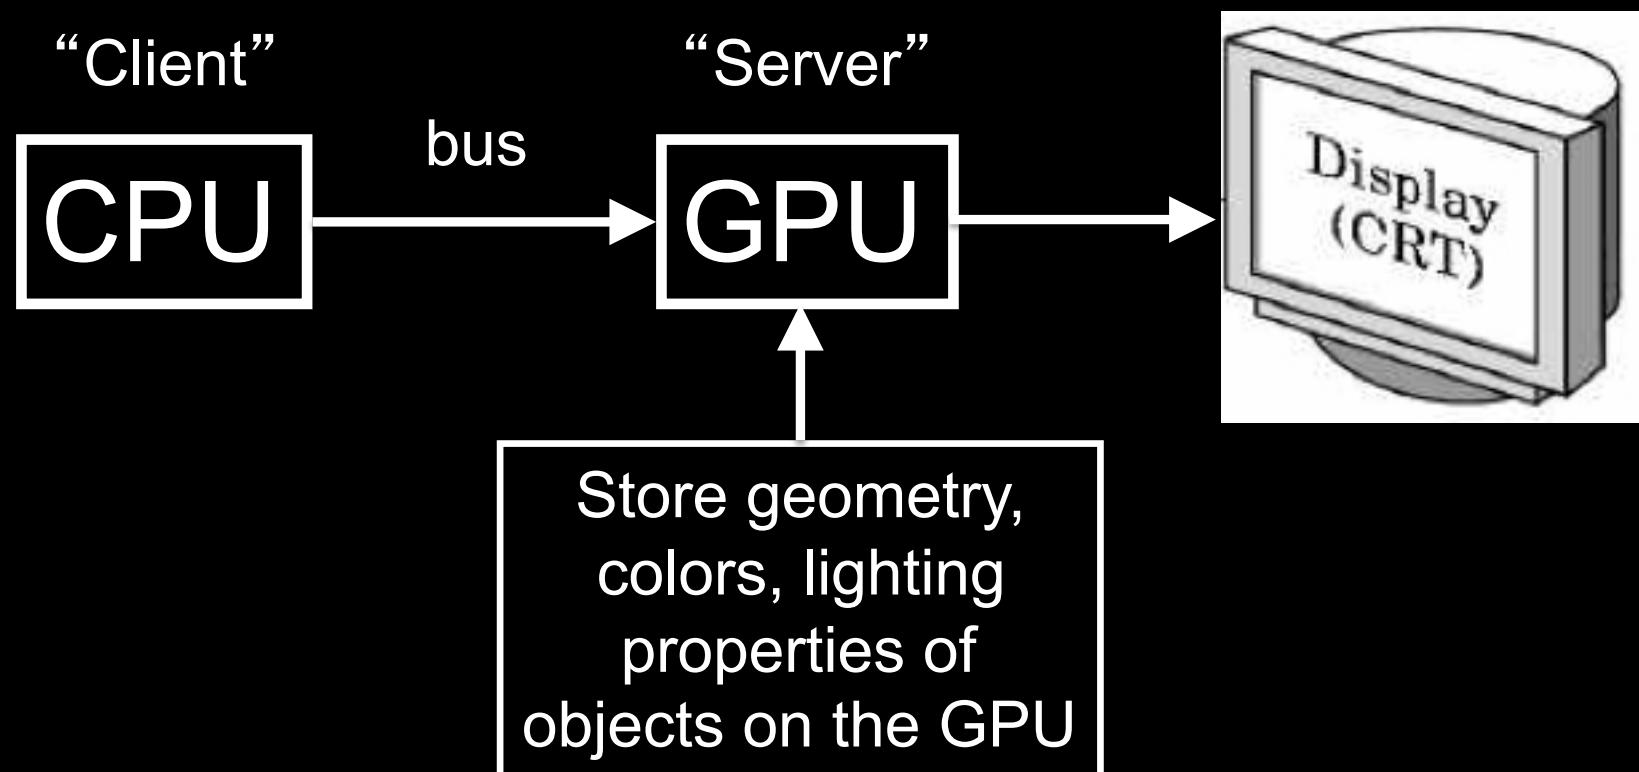

- Important for efficiency
- Need to be aware where data are stored
- Examples: vertex arrays, display lists

The CPU-GPU bus

Display Lists

- Cache a sequence of drawing commands
- Optimize and store on server (GPU)

Display Lists

- Cache a sequence of drawing commands
- Optimize and store on server (GPU)

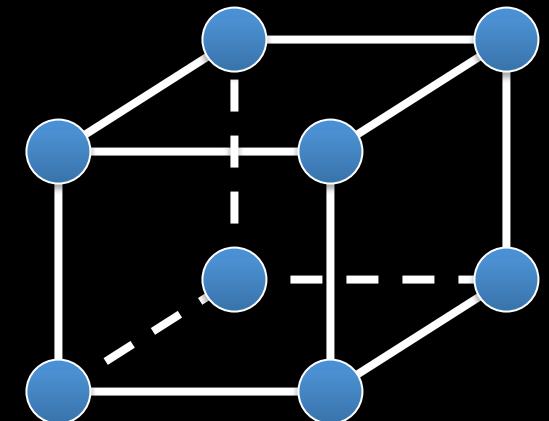

```
GLuint listName = glGenLists(1); /* new list name */  
glNewList(listName, GL_COMPILE); /* new list */  
    glColor3f(1.0, 0.0, 1.0);  
    glBegin(GL_TRIANGLES);  
        glVertex3f(0.0, 0.0, 0.0);  
        ...  
    glEnd();  
glEndList(); /* at this point, OpenGL compiles the list */  
glCallList(listName); /* draw the object */
```

Display Lists Details

- Very useful with complex objects that are redrawn often (e.g., with transformations)
 - Another example: fonts (2D or 3D)
 - Display lists can call other display lists
 - Display lists cannot be changed
 - Display lists can be erased / replaced
 - Not necessary in first assignment
-
- Display lists are now deprecated in OpenGL
 - For complex usage, use the VertexBufferObject (VBO) extension

Vertex Arrays

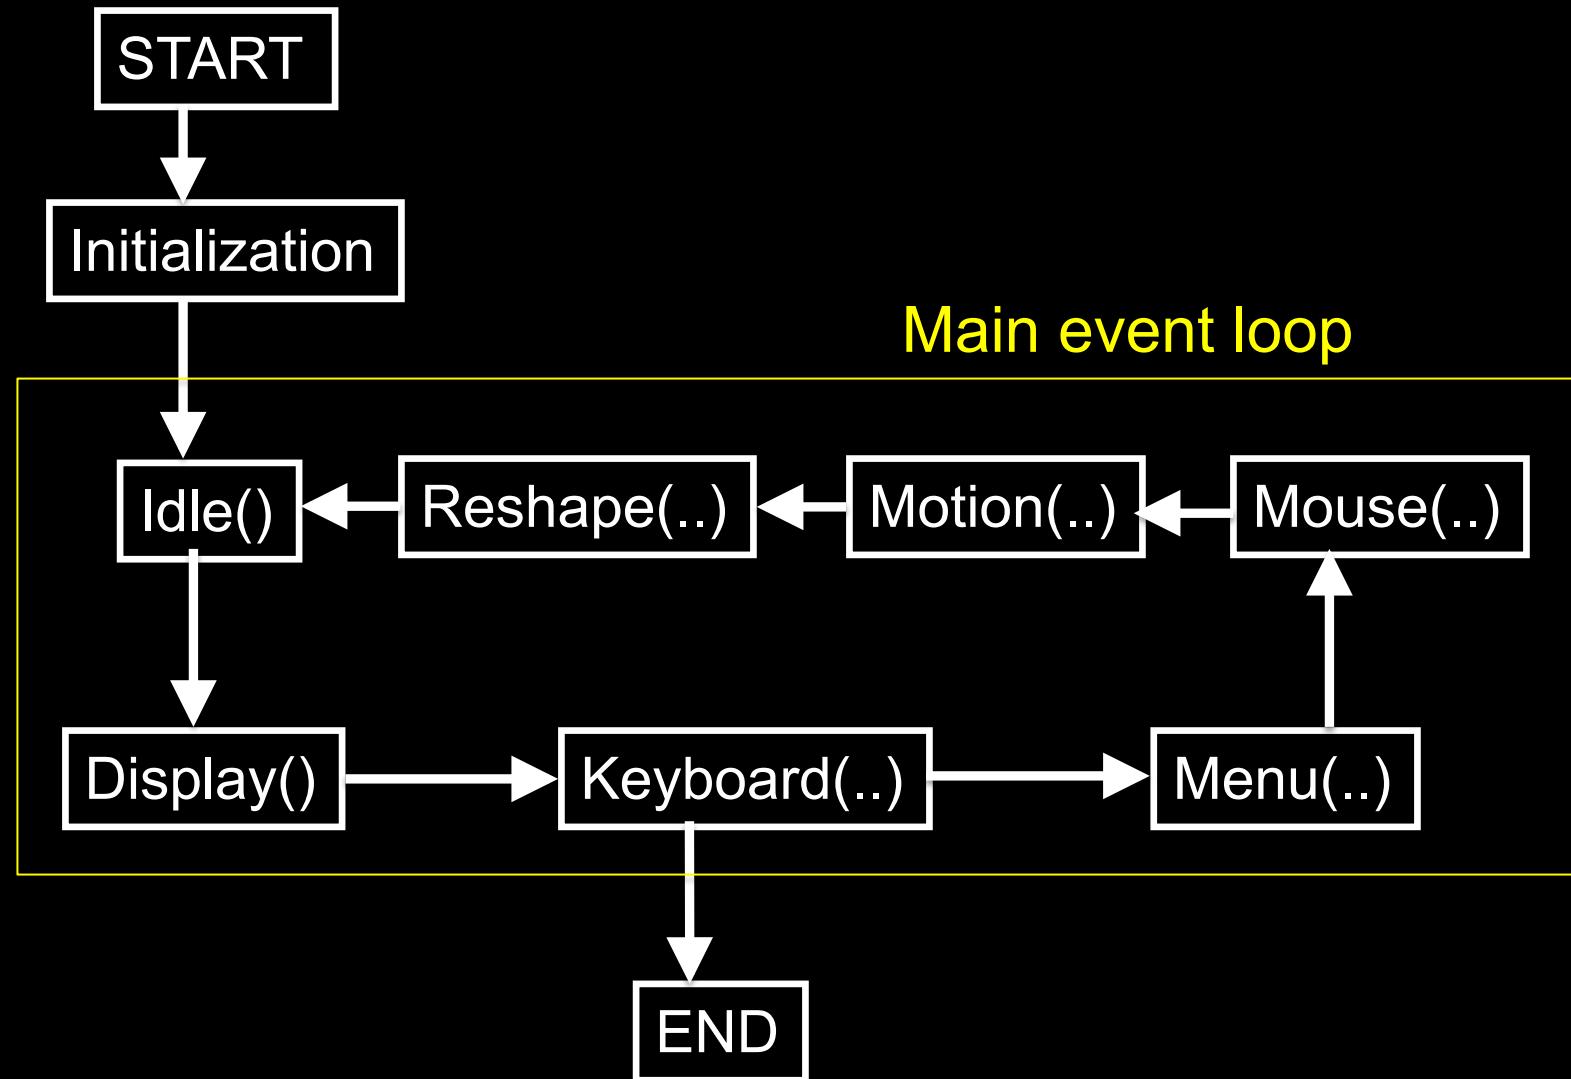

- Draw cube with $6*4=24$ or with 8 vertices?
- Expense in drawing and transformation
- Strips help to some extent
- Vertex arrays provide general solution
- Advanced (since OpenGL 1.2)
 - Define (transmit) array of vertices, colors, normals
 - Draw using index into array(s)
 - Vertex sharing for efficient operations
- Not needed for first assignment

Outline

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

GLUT Program with Callbacks

Main Event Loop

- Standard technique for interaction
(GLUT, Qt, wxWidgets, ...)
- Main loop processes events
- Dispatch to functions specified by client
- Callbacks also common in operating systems
- “Poor man’s functional programming”

Types of Callbacks

- Display () : when window must be drawn
- Idle () : when no other events to be handled
- Keyboard (unsigned char key, int x, int y) : key pressed
- Menu (...) : after selection from menu
- Mouse (int button, int state, int x, int y) : mouse button
- Motion (...) : mouse movement
- Reshape (int w, int h) : window resize
- Any callback can be NULL

Outline

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Screen Refresh

- Common: 60-100 Hz
- Flicker if drawing overlaps screen refresh
- Problem during animation
- Solution: use two separate **frame buffers**:
 - Draw into one buffer
 - Swap and display, while drawing into other buffer
- Desirable frame rate ≥ 30 fps (frames/second)

Enabling Single/Double Buffering

- `glutInitDisplayMode(GLUT_SINGLE);`
- `glutInitDisplayMode(GLUT_DOUBLE);`
- Single buffering:
Must call `glFinish()` at the end of `Display()`
- Double buffering:
Must call `glutSwapBuffers()` at the end of `Display()`
- Must call `glutPostRedisplay()` at the end of `Idle()`
- If something in OpenGL has no effect or does not work, check the modes in `glutInitDisplayMode`

Outline

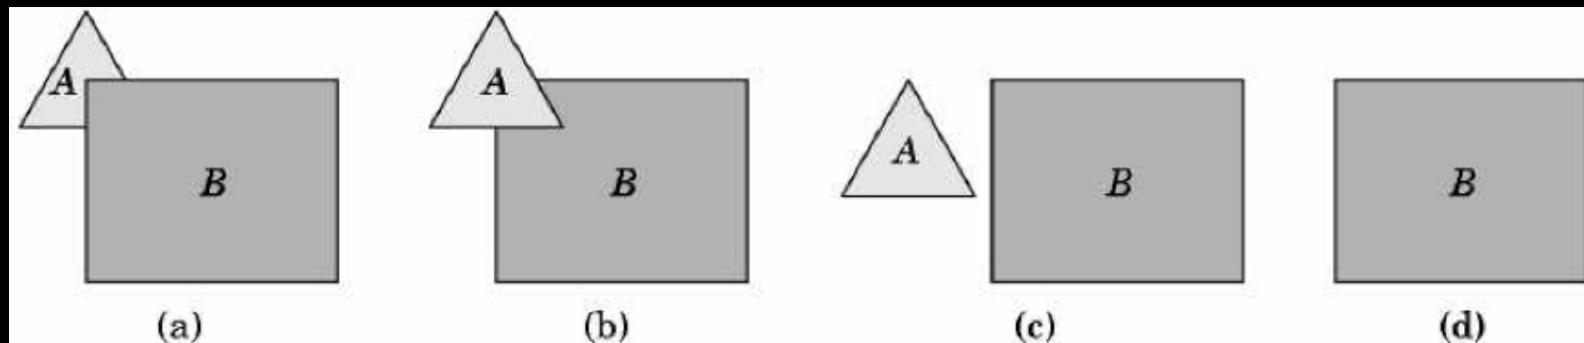

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Hidden Surface Removal

- Classic problem of computer graphics
- What is visible after clipping and projection?
- Object-space vs image-space approaches
- Object space: depth sort (Painter's algorithm)
- Image space: *z-buffer* algorithm
- Related: back-face culling

Object-Space Approach

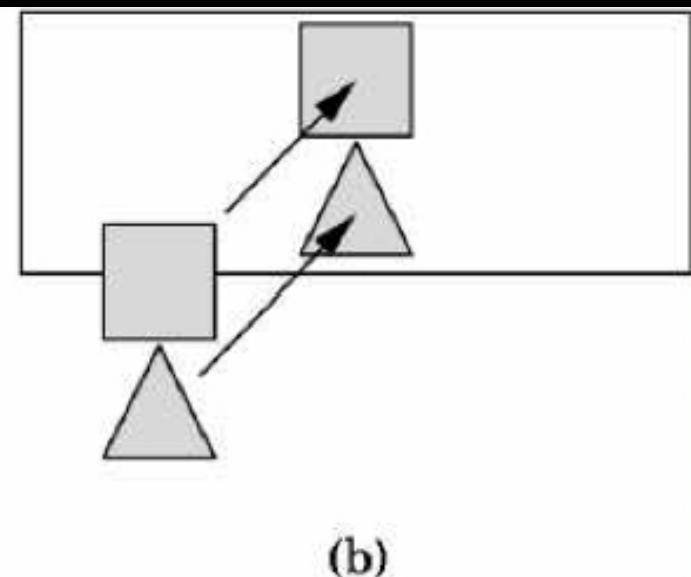

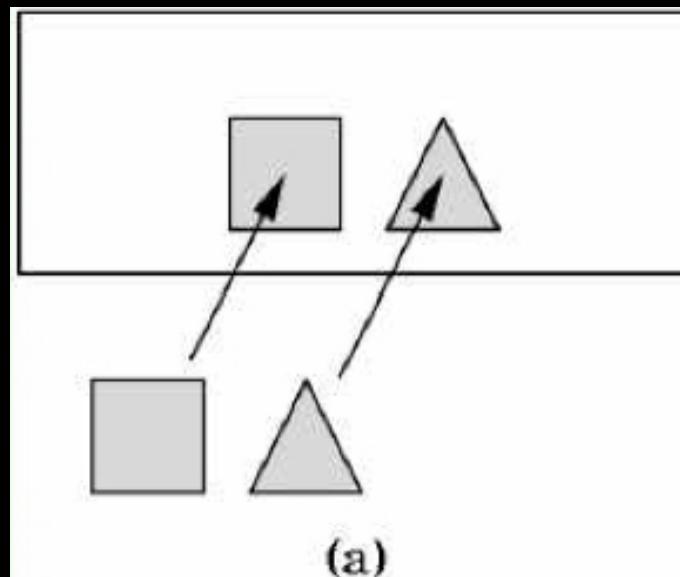

- Consider objects pairwise

- Complexity $O(k^2)$ where $k = \#$ of objects
- Painter's algorithm: render back-to-front
- “Paint” over invisible polygons
- How to sort and how to test overlap?

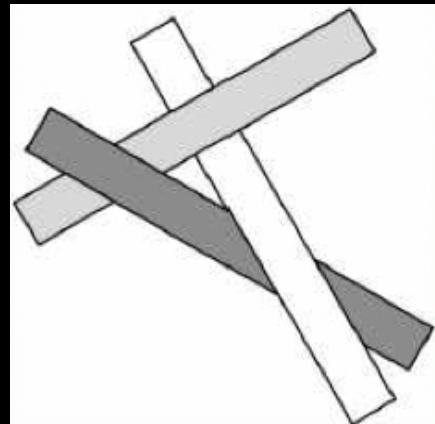

Depth Sorting

- First, sort by furthest distance z from viewer
- If minimum depth of A is greater than maximum depth of B, A can be drawn before B
- If either x or y extents do not overlap, A and B can be drawn independently

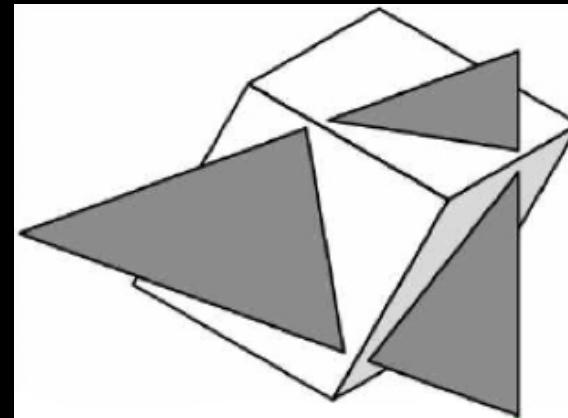

Some Difficult Cases

- Sometimes cannot sort polygons!

Cyclic overlap

Piercing Polygons

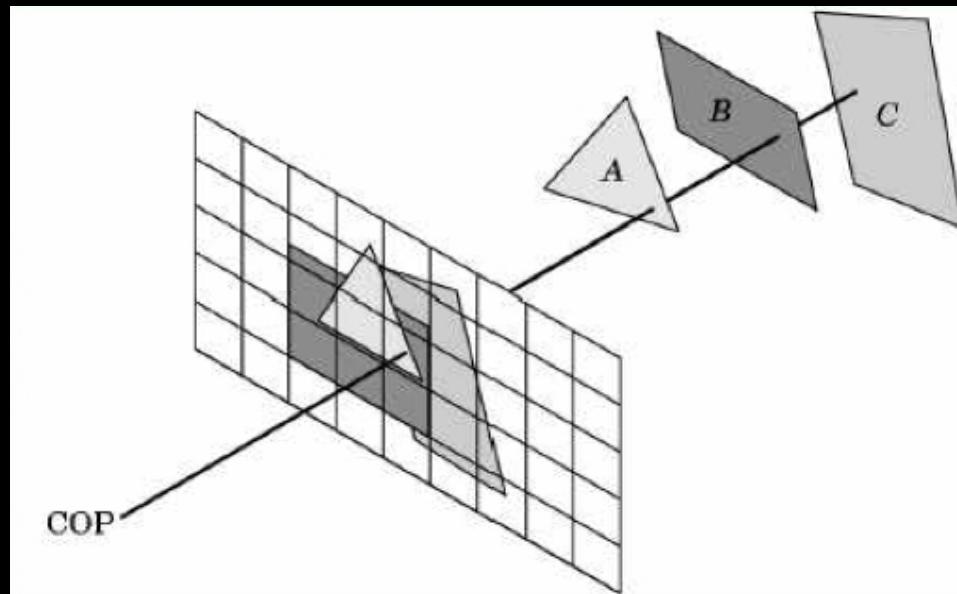

- One solution: compute intersections & subdivide
- Do while rasterizing (difficult in object space)

Painter's Algorithm Assessment

- Strengths
 - Simple (most of the time)
 - Handles transparency well
 - Sometimes, no need to sort (e.g., heightfield)
- Weaknesses
 - Clumsy when geometry is complex
 - Sorting can be expensive
- Usage
 - PostScript interpreters
 - OpenGL: not supported
(must implement Painter's Algorithm manually)

Image-Space Approach

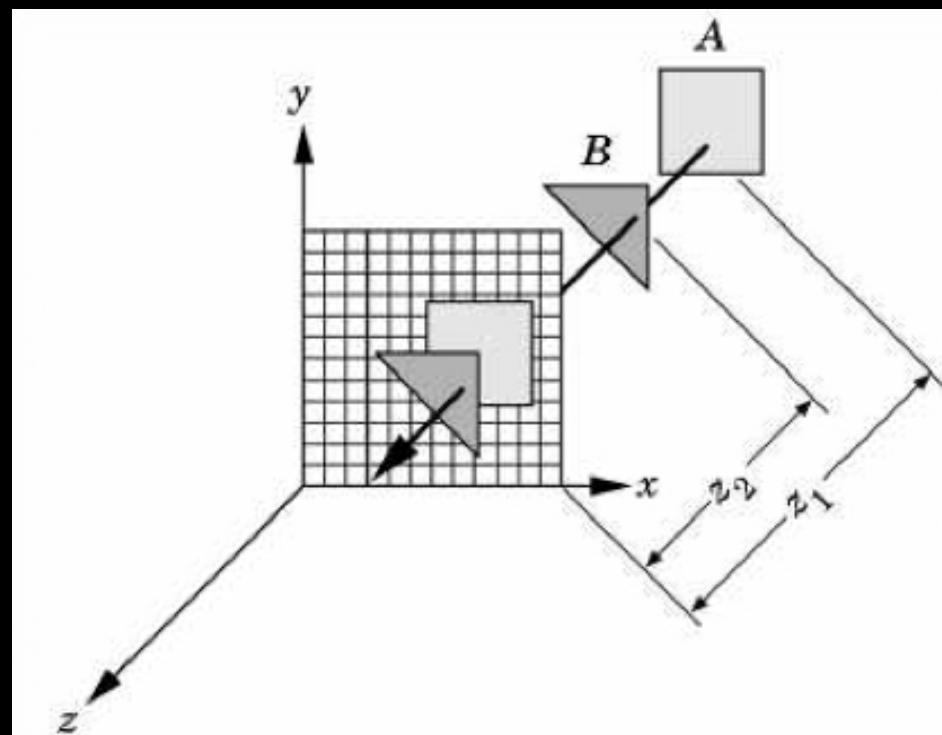

- Raycasting: intersect ray with polygons

- $O(k)$ worst case (often better)
- Images can be more jagged (need anti-aliasing)

The z-Buffer Algorithm

- z-buffer stores depth values z for each pixel
- Before writing a pixel into framebuffer:
 - Compute distance z of pixel from viewer
 - If closer, write and update z-buffer, otherwise discard

z-Buffer Algorithm Assessment

- Strengths
 - Simple (no sorting or splitting)
 - Independent of geometric primitives
- Weaknesses
 - Memory intensive (but memory is cheap now)
 - Tricky to handle transparency and blending
 - Depth-ordering artifacts
- Usage
 - z-Buffering comes standard with OpenGL;
disabled by default; must be enabled

Depth Buffer in OpenGL

- `glutInitDisplayMode(GLUT_DOUBLE | GLUT_RGBA | GLUT_DEPTH);`
- `glEnable (GL_DEPTH_TEST);`
- Inside `Display()`:
 `glClear (GL_DEPTH_BUFFER_BIT);`
- Remember all of these!
- Some “tricks” use z-buffer in read-only mode

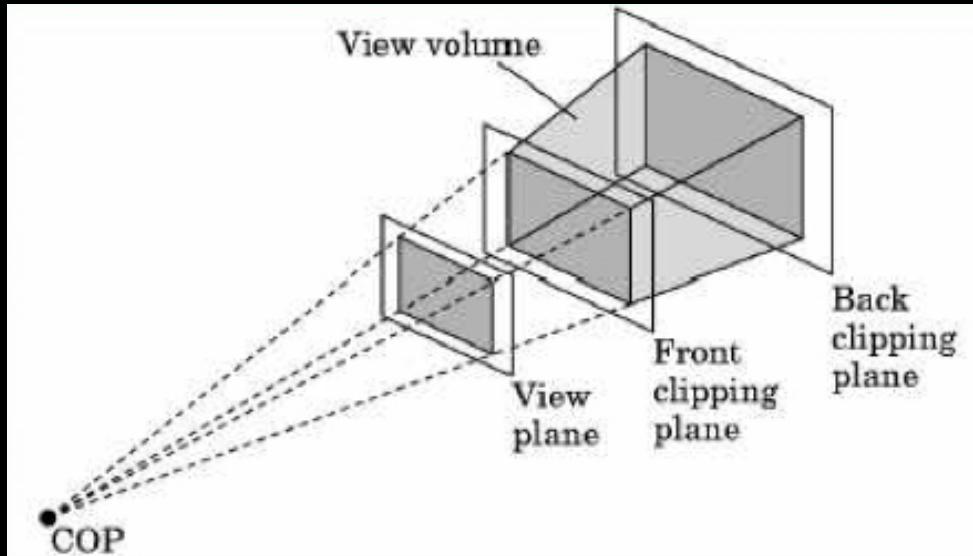

Outline

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Specifying the Viewing Volume

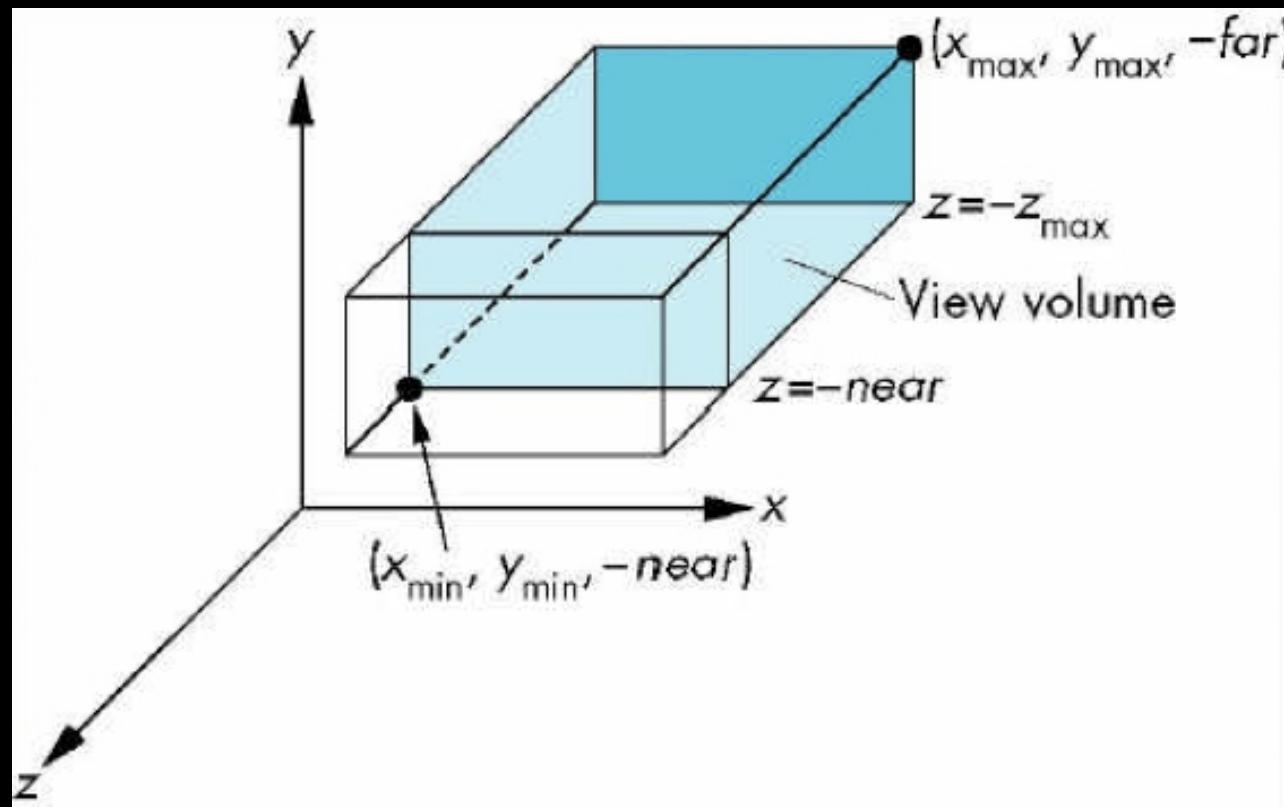

- Clip everything not in viewing volume
- Separate matrices for transformation and projection

```
glMatrixMode(GL_PROJECTION);
glLoadIdentity();
... Set viewing volume ...
glMatrixMode(GL_MODELVIEW);
```

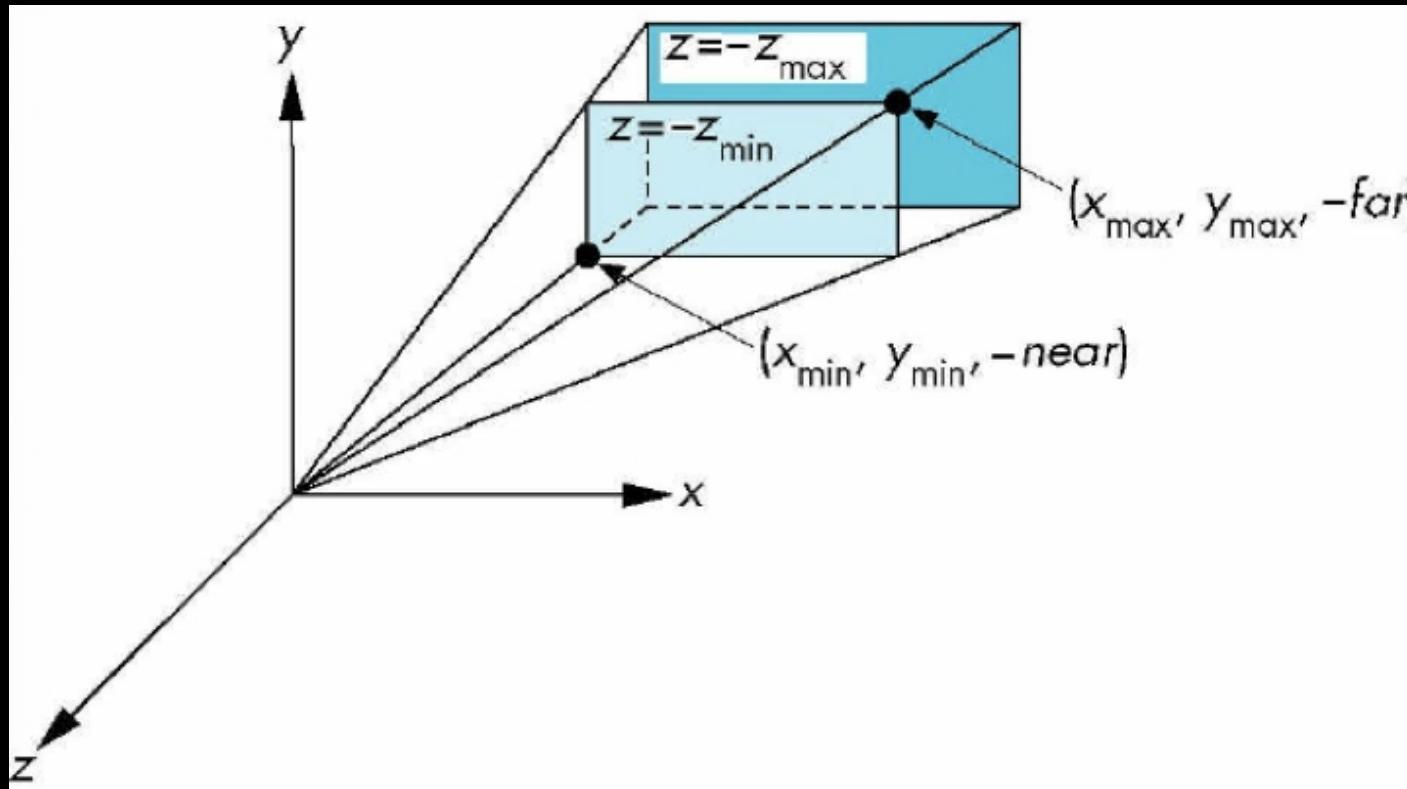

Parallel Viewing

- Orthographic projection
- Camera points in negative z direction
- `glOrtho(xmin, xmax, ymin, ymax, near, far)`

Perspective Viewing

- Slightly more complex
- `glFrustum(xmin, xmax, ymin, ymax, near, far)`

Simple Transformations

- Rotate by given angle (in degrees) about axis given by (x, y, z)

`glRotate{fd}(angle, x, y, z);`

- Translate by the given x, y, and z values

`glTranslate{fd}(x, y, z);`

- Scale with a factor in the x, y, and z direction

`glScale{fd}(x, y, z);`

Outline

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Example: Rotating Color Cube

- Adapted from [Angel, Ch. 4]
- Problem:
 - Draw a color cube
 - Rotate it about x, y, or z axis, depending on left, middle or right mouse click
 - Stop when space bar is pressed
 - Quit when q or Q is pressed

Step 1: Defining the Vertices

- Use parallel arrays for vertices and colors

```
/* vertices of cube about the origin */  
GLfloat vertices[8][3] =  
{{{-1.0, -1.0, -1.0}, {1.0, -1.0, -1.0},  
{1.0, 1.0, -1.0}, {-1.0, 1.0, -1.0}, {-1.0, -1.0, 1.0},  
{1.0, -1.0, 1.0}, {1.0, 1.0, 1.0}, {-1.0, 1.0, 1.0}}};
```

```
/* colors to be assigned to vertices */  
GLfloat colors[8][3] =  
{{{0.0, 0.0, 0.0}, {1.0, 0.0, 0.0},  
{1.0, 1.0, 0.0}, {0.0, 1.0, 0.0}, {0.0, 0.0, 1.0},  
{1.0, 0.0, 1.0}, {1.0, 1.0, 1.0}, {0.0, 1.0, 1.0}}};
```

Step 2: Set Up z-buffer and Double Buffering

```
int main(int argc, char **argv)
{
    glutInit(&argc, argv);
    /* double buffering for smooth animation */
    glutInitDisplayMode
        (GLUT_DOUBLE | GLUT_DEPTH | GLUT_RGB);
    ...    /* window creation and callbacks here */
    glEnable(GL_DEPTH_TEST);
    glutMainLoop();
    return(0);
}
```

Step 3: Install Callbacks

- Create window and set callbacks

```
glutInitWindowSize(500, 500);
```

```
glutCreateWindow("cube");
```

```
glutReshapeFunc(myReshape);
```

```
glutDisplayFunc(display);
```

```
glutIdleFunc(spinCube);
```

```
glutMouseFunc(mouse);
```

```
glutKeyboardFunc(keyboard);
```

Step 4: Reshape Callback

- Set projection and viewport, preserve aspect ratio

```
void myReshape(int w, int h)
{
    GLfloat aspect = (GLfloat) w / (GLfloat) h;
    glViewport(0, 0, w, h);
    glMatrixMode(GL_PROJECTION);
    glLoadIdentity();
    if (w <= h) /* aspect <= 1 */
        glOrtho(-2.0, 2.0, -2.0/aspect, 2.0/aspect, -10.0, 10.0);
    else /* aspect > 1 */
        glOrtho(-2.0*aspect, 2.0*aspect, -2.0, 2.0, -10.0, 10.0);
    glMatrixMode(GL_MODELVIEW);
}
```

Step 5: Display Callback

- Clear, rotate, draw, flush, swap

```
GLfloat theta[3] = {0.0, 0.0, 0.0};
```

```
void display(void)
{
    glClear(GL_COLOR_BUFFER_BIT
            | GL_DEPTH_BUFFER_BIT);
    glLoadIdentity();
    glRotatef(theta[0], 1.0, 0.0, 0.0);
    glRotatef(theta[1], 0.0, 1.0, 0.0);
    glRotatef(theta[2], 0.0, 0.0, 1.0);
    colorcube();
    glutSwapBuffers();
}
```

Step 6: Drawing Faces

- Call `face(a, b, c, d)` with vertex index
- Orient consistently

```
void colorcube(void)
{
    face(0,3,2,1);
    face(2,3,7,6);
    face(0,4,7,3);
    face(1,2,6,5);
    face(4,5,6,7);
    face(0,1,5,4);
}
```

Step 7: Drawing a Face

- Use vector form of primitives and attributes

```
void face(int a, int b, int c, int d)
{
    glBegin(GL_POLYGON);
    glColor3fv(colors[a]);
    glVertex3fv(vertices[a]);
    glColor3fv(colors[b]);
    glVertex3fv(vertices[b]);
    glColor3fv(colors[c]);
    glVertex3fv(vertices[c]);
    glColor3fv(colors[d]);
    glVertex3fv(vertices[d]);
    glEnd();
}
```

Step 8: Animation

- Set idle callback

```
GLfloat delta = 2.0;  
GLint axis = 2;  
void spinCube()  
{  
    /* spin the cube delta degrees about selected axis */  
    theta[axis] += delta;  
    if (theta[axis] > 360.0) theta[axis] -= 360.0;  
  
    /* display result (do not forget this!) */  
    glutPostRedisplay();  
}
```

Step 9: Change Axis of Rotation

- Mouse callback

```
void mouse(int btn, int state, int x, int y)
{
    if ((btn==GLUT_LEFT_BUTTON) && (state == GLUT_DOWN))
        axis = 0;

    if ((btn==GLUT_MIDDLE_BUTTON) && (state == GLUT_DOWN))
        axis = 1;

    if ((btn==GLUT_RIGHT_BUTTON)&& (state == GLUT_DOWN))
        axis = 2;
}
```

Step 10: Toggle Rotation or Exit

- Keyboard callback

```
void keyboard(unsigned char key, int x, int y)
{
    if (key=='q' || key == 'Q')
        exit(0);
    if (key==' ')
        stop = !stop;
    if (stop)
        glutIdleFunc(NULL);
    else
        glutIdleFunc(spinCube);
}
```

Summary

- Client/Server Model
- Callbacks
- Double Buffering
- Hidden Surface Removal
- Simple Transformations
- Example

Announcements

- Assignment 1 will be posted this week
- Microsoft Visual Studio (Windows) access enabled via Microsoft's MSDN
- Please start early
- Check web page for instructions
