### Setting the Current Model-view Matrix

- Load or post-multiply

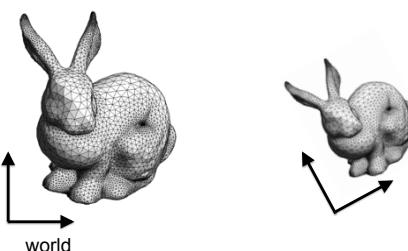

```
glMatrixMode(GL_MODELVIEW);
glLoadIdentity(); // very common usage
float m[16] = { ... };
glLoadMatrixf(m); // rare, advanced
glMultMatrixf(m); // rare, advanced
```

- Use library functions

```
glTranslatef(dx, dy, dz);
glRotatef(angle, vx, vy, vz);
glScalef(sx, sy, sz);
```

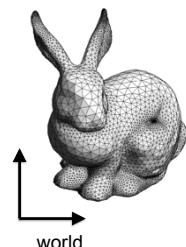

7

### Translated, rotated, scaled object

8

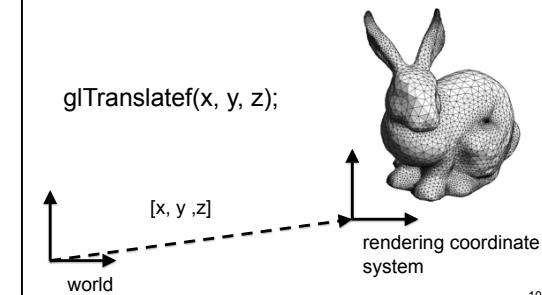

### The *rendering* coordinate system

Initially (after `glLoadIdentity()`) :  
rendering coordinate system = world coordinate system

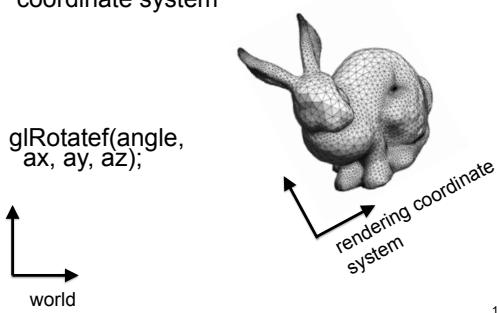

9

### The *rendering* coordinate system

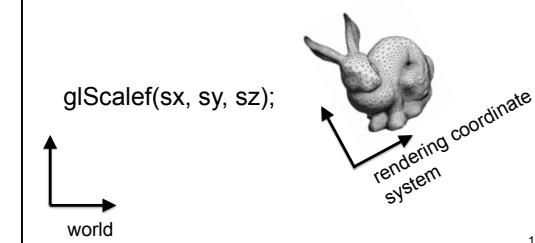

10

### The *rendering* coordinate system

11

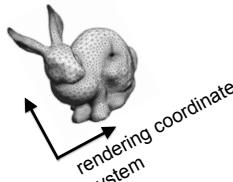

### The *rendering* coordinate system

12

## OpenGL code

```
glMatrixMode(GL_MODELVIEW);
glLoadIdentity();
glTranslatef(x, y, z);
glRotatef(angle, ax, ay, az);
glScalef(sx, sy, sz);
renderBunny();
```

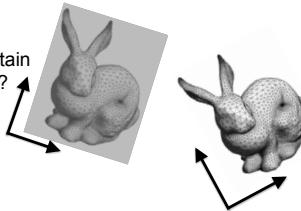

13

## Rendering more objects

How to obtain  
this frame?

world

14

## Solution 1:

Find glTranslate(...), glRotatef(...),  
glScalef(...)How to obtain  
this frame?

15

## Solution 2: gl{Push,Pop}Matrix

```
glMatrixMode(GL_MODELVIEW);
glLoadIdentity();

// render first bunny
glPushMatrix(); // store current matrix
glTranslate3f(...);
glRotatef(...);
renderBunny();
glPopMatrix(); // pop matrix

// render second bunny
glPushMatrix(); // store current matrix
glTranslate3f(...);
glRotatef(...);
renderBunny();
glPopMatrix(); // pop matrix world
```

16

## 3D Math Review

17

## Scalars

- Scalars  $\alpha, \beta, \gamma$  from a *scalar field*
- Operations  $\alpha+\beta, \alpha \cdot \beta, 0, 1, -\alpha, (\ )^{-1}$
- “Expected” laws apply
- Examples: rationals or reals with addition and multiplication

18

## Vectors

- Vectors  $u, v, w$  from a *vector space*
- Vector addition  $u + v$ , subtraction  $u - v$
- Zero vector  $\mathbf{0}$
- Scalar multiplication  $\alpha v$

19

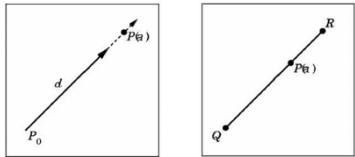

## Euclidean Space

- Vector space over real numbers
- Three-dimensional in computer graphics
- Dot product:  $\alpha = u \cdot v = u_1 v_1 + u_2 v_2 + u_3 v_3$
- $\mathbf{0} \cdot \mathbf{0} = 0$
- $u, v$  are *orthogonal* if  $u \cdot v = 0$
- $|v|^2 = v \cdot v$  defines  $|v|$ , the *length* of  $v$

20

## Lines and Line Segments

- Parametric form of line:  $P(\alpha) = P_0 + \alpha d$

- Line segment between  $Q$  and  $R$ :  

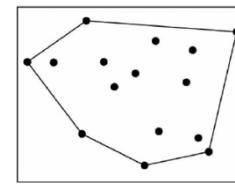

$$P(\alpha) = (1-\alpha) Q + \alpha R \text{ for } 0 \leq \alpha \leq 1$$

21

## Convex Hull

- Convex hull defined by  

$$P = \alpha_1 P_1 + \dots + \alpha_n P_n$$
  
 for  $\alpha_1 + \dots + \alpha_n = 1$   
 and  $0 \leq \alpha_i \leq 1, i = 1, \dots, n$

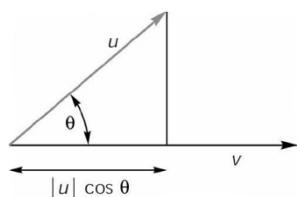

22

## Projection

- Dot product projects one vector onto another vector  

$$u \cdot v = u_1 v_1 + u_2 v_2 + u_3 v_3 = |u| |v| \cos(\theta)$$
  

$$\text{pr}_v u = (u \cdot v) v / |v|^2$$

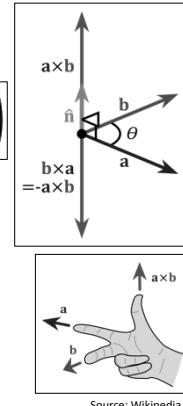

23

## Cross Product

$$\begin{pmatrix} a_1 \\ a_2 \\ a_3 \end{pmatrix} \times \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix} = \begin{pmatrix} a_2 b_3 - a_3 b_2 \\ a_3 b_1 - a_1 b_3 \\ a_1 b_2 - a_2 b_1 \end{pmatrix}$$

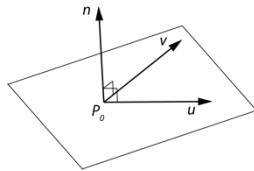

- $|a \times b| = |a| |b| |\sin(\theta)|$
- Cross product is perpendicular to both  $a$  and  $b$
- Right-hand rule

Source: Wikipedia

**Plane**

- Plane defined by point  $P_0$  and vectors  $u$  and  $v$

25

- $u$  and  $v$  should not be parallel

- Parametric form:

$$T(\alpha, \beta) = P_0 + \alpha u + \beta v$$

( $\alpha$  and  $\beta$  are scalars)

- $n = u \times v / |u \times v|$  is the normal

- $n \cdot (P - P_0) = 0$  if and only if  $P$  lies in plane

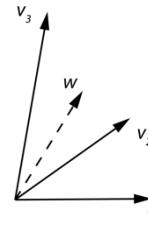

**Coordinate Systems**

- Let  $v_1, v_2, v_3$  be three linearly independent vectors in a 3-dimensional vector space

- Can write any vector  $w$  as

$$w = \alpha_1 v_1 + \alpha_2 v_2 + \alpha_3 v_3$$

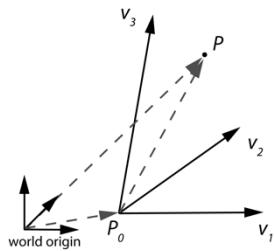

for some scalars  $\alpha_1, \alpha_2, \alpha_3$

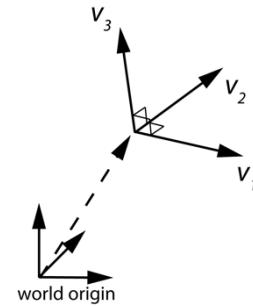

26

**Frames**

- Frame = origin  $P_0$  + coordinate system
- Any point  $P = P_0 + \alpha_1 v_1 + \alpha_2 v_2 + \alpha_3 v_3$

27

**In Practice, Frames are Often Orthogonal**

28

**Change of Coordinate System**

- Bases  $\{u_1, u_2, u_3\}$  and  $\{v_1, v_2, v_3\}$
- Express basis vectors  $u_i$  in terms of  $v_j$

$$u_1 = \gamma_{11}v_1 + \gamma_{12}v_2 + \gamma_{13}v_3$$

$$u_2 = \gamma_{21}v_1 + \gamma_{22}v_2 + \gamma_{23}v_3$$

$$u_3 = \gamma_{31}v_1 + \gamma_{32}v_2 + \gamma_{33}v_3$$

- Represent in matrix form:

$$\begin{bmatrix} u_1 \\ u_2 \\ u_3 \end{bmatrix} = M \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} \quad M = \begin{bmatrix} \gamma_{11} & \gamma_{12} & \gamma_{13} \\ \gamma_{21} & \gamma_{22} & \gamma_{23} \\ \gamma_{31} & \gamma_{32} & \gamma_{33} \end{bmatrix}$$

29

**Representing  
3D transformations  
(and model-view matrices)**

30

### Linear Transformations

- $3 \times 3$  matrices represent linear transformations  
 $\mathbf{a} = \mathbf{M}\mathbf{b}$
- Can represent rotation, scaling, and reflection
- Cannot represent translation

$$M = \begin{bmatrix} \gamma_{11} & \gamma_{12} & \gamma_{13} \\ \gamma_{21} & \gamma_{22} & \gamma_{23} \\ \gamma_{31} & \gamma_{32} & \gamma_{33} \end{bmatrix}$$

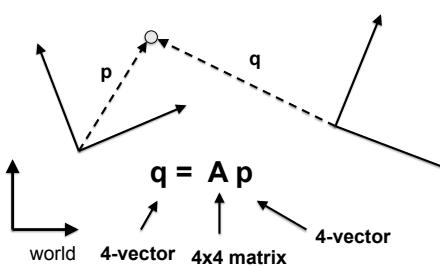

31

### In order to represent rotations, scales AND translations: Homogeneous Coordinates

- Augment  $[\alpha_1 \ \alpha_2 \ \alpha_3]^T$  by adding a fourth component (1):  
 $\mathbf{p} = [\alpha_1 \ \alpha_2 \ \alpha_3 \ 1]^T$
- Homogeneous property:  
 $\mathbf{p} = [\alpha_1 \ \alpha_2 \ \alpha_3 \ 1]^T = [\beta\alpha_1 \ \beta\alpha_2 \ \beta\alpha_3 \ \beta]^T$ ,  
for any scalar  $\beta \neq 0$

32

### Homogeneous coordinates are transformed by $4 \times 4$ matrices

33

### Affine Transformations ( $4 \times 4$ matrices)

- Translation
- Rotation
- Scaling
- Any composition of the above
- Later: projective (perspective) transformations
  - Also expressible as  $4 \times 4$  matrices!

34

### Translation

- $\mathbf{q} = \mathbf{p} + \mathbf{d}$  where  $\mathbf{d} = [\alpha_x \ \alpha_y \ \alpha_z \ 0]^T$
- $\mathbf{p} = [x \ y \ z \ 1]^T$
- $\mathbf{q} = [x' \ y' \ z' \ 1]^T$
- Express in matrix form  $\mathbf{q} = \mathbf{T} \mathbf{p}$  and solve for  $\mathbf{T}$

$$T = \begin{bmatrix} 1 & 0 & 0 & \alpha_x \\ 0 & 1 & 0 & \alpha_y \\ 0 & 0 & 1 & \alpha_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

35

### Scaling

- $x' = \beta_x x$
- $y' = \beta_y y$
- $z' = \beta_z z$
- Express as  $\mathbf{q} = \mathbf{S} \mathbf{p}$  and solve for  $\mathbf{S}$

$$S = \begin{bmatrix} \beta_x & 0 & 0 & 0 \\ 0 & \beta_y & 0 & 0 \\ 0 & 0 & \beta_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

36

### Rotation in 2 Dimensions

- Rotation by  $\theta$  about the origin
- $x' = x \cos \theta - y \sin \theta$
- $y' = x \sin \theta + y \cos \theta$
- Express in matrix form:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

- Note that the determinant is 1

37

### Rotation in 3 Dimensions

- Orthogonal matrices:

$$RR^T = R^T R = I$$

$$\det(R) = 1$$

- Affine transformation:

$$A = \begin{bmatrix} R_{11} & R_{12} & R_{13} & 0 \\ R_{21} & R_{22} & R_{23} & 0 \\ R_{31} & R_{32} & R_{33} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

38

### Affine Matrices are Composed by Matrix Multiplication

- $A = A_1 A_2 A_3$
- Applied from right to left
- $A p = (A_1 A_2 A_3) p = A_1 (A_2 (A_3 p))$
- When calling `glTranslate3f`, `glRotatef`, or `glScalef`, OpenGL forms the corresponding 4x4 matrix, and multiplies the current modelview matrix with it.

39

### Summary

- OpenGL Transformation Matrices
- Vector Spaces
- Frames
- Homogeneous Coordinates
- Transformation Matrices
